Milking:

- When we get ready to milk, we put a sanitizer with aloe on the teats. I then squirt a little milk on the ground (by hand) before putting on the teat cup(s).
- Place the teat cup on damp teat and press and hold the button on the vacuum pump. It may take 5 to 10 seconds to create a vacuum.
 - You can release the button once the milk starts to flow.
- When you see the milk start to flow, stop pumping. Do not continue pumping, as you can harm the animal.
- Re-press the button when the milk slows down. If you really want the milk to pour out, take both hands and reach all the way to the top of her udder on both sides and start to gently squeeze and release thus pulsing the udder.
- You will see the milk pour into the jar and you will be able to hear the milk going into the jar. Don't forget to keep an eye on your vacuum, as you may need to press the vacuum button to keep a good suction.
- When first learning to milk with your Dansha Farms milk machine, it is helpful to have someone to assist you in holding the teat cups on the udder until you achieve a vacuum

Cleaning:

-HOW TO PURGE YOUR PUMP

- Sometimes milk, foam or milk vapor gets into the pump and slows it down.
- Take and disconnect the black vacuum line and the clear line at the pump.
- Turn on your pump and run a small amount of water into the inlet of the pump while it is running.
- You will see water spitting out of the exhaust.-Shut off the water and let the pump run and purge itself out for a minute
- To Clean and sanitize the milker lines immerse in hot (not boiling) water with just a bit of vinegar. It is very important that you do not immerse the pump in water (or get milk or foam into the pump).
- Next, run hot water from the faucet through the milk line and teat cup(s). In no time, the milker lines and teat cups are clean.
- Hint: You can use the supplied teat cup plungers to swish the water through the milk lines.
- Hint: From time to time, you can use a metal coat hanger with a cloth at the end to clean your milk lines too.

Important Note:

When we manufacture our milkers, we use Polyurethane cement on the inside of the cover. We do this to provide for a rigid lid and an air tight connection, so a continuous vacuum can be obtained. The cement becomes “inert” when it sets up and will not give any odor or contaminate your milk.

Yes, polyurethanes are safe.

Polyurethanes are derived from chemicals called diisocyanates and polyols that undergo a reaction to form an inert substance – polyurethane. Substantial research has shown polyurethanes to be safe and inert.

Our Commitment to You

Dansha Farms™ is here to provide you with top notch Customer Service. Our reputation speaks for itself. We are proud that we have satisfied customers all over the world.
